

CogniumLearn User Manual

The complete guide to AI-powered spaced-repetition learning

17 July 2026

CogniumLearn turns your notes, syllabi and textbooks into flashcards, study materials and mock tests — then schedules your revision with proven spaced-repetition science so you remember more in less time. This manual walks through every feature and explains exactly how credits and plans work.

What is CogniumLearn

CogniumLearn is an AI-powered learning platform built around spaced repetition — the study technique of reviewing material at increasing intervals so it moves into long-term memory. You upload documents or type your own content, and CogniumLearn generates the study assets for you. As you study, it tracks how well you know each item using the FSRS scheduling algorithm and a Glicko-2 mastery rating, and shows you exactly where you are weak, strong, or inconsistent.

What you can do with it:

- **Build decks** — organise flashcards into a tidy, nested subject tree.
- **Generate automatically** — upload a PDF or syllabus and let the AI write cards, notes and tests.
- **Study smart** — revise on an optimised schedule that adapts to your performance.
- **See your progress** — heatmaps, mastery reports and AI topic insights per deck.
- **Ask the AI** — get explanations while you study, or chat with a tutor that knows your deck.
- **Buy ready-made decks** — browse a marketplace of professionally curated content.
- **Study anywhere** — web, desktop and mobile apps that sync and work offline.

Getting Started

Sign in with your Google account (or request a one-time email code) and you are ready to go — there is nothing to install to use the web app. The first time you open CogniumLearn on a new device, an interactive tutorial runs automatically, demonstrating the AI and paid features on a safe sample deck that spends no credits and touches no real data. You can replay any tutorial later from the Tutorials page in the home menu.

Every new account receives a small welcome grant of **5 free credits** so you can try the AI features before deciding on a plan. Larger bonuses are handed out through promo codes (see Coupons & Promo Codes).

Decks & Cards

A **deck** is a collection of flashcards, study materials and mock tests. Decks are hierarchical — you can nest a deck inside another to mirror the structure of a subject (for example *Biology* → *Cell Biology* → *Mitosis*). The home page shows your decks as tiles; tap a tile to drill into its sub-decks or to start studying.

Working with decks and cards:

- **Create a deck** — give it a name, an optional short name for tight spaces, and tags for grouping.
- **Organise a hierarchy** — set a parent deck to build a nested subject tree.

- **Add or edit cards** — the card editor supports rich text, images, and LaTeX for equations on both the question and answer.
- **Tag and flag** — tag individual cards, or mark a card for later review.
- **Reset progress** — wipe a card's learning history to start it fresh.
- **Auto-analysis toggle** — enable weekly performance analysis and auto-generated curated study per deck from the deck editor.

Automatic Content Generation

This is the heart of CogniumLearn. Upload your material — PDFs, images, documents, a specific web page, or a syllabus/question paper — and the AI produces study assets for you. You can also draw from the open web or reputable external sources, or have the AI create content from a prompt.

You choose what gets generated:

- **Flashcards** — set how many, the difficulty, and the question types (multiple choice, multiple correct, objective, or short / medium / long subjective).
- **Study materials** — organised notes at three depths — Summary, Standard, or Comprehensive — with a chosen number of sections.
- **Mock tests** — full timed papers with sections, page ranges from the source, question counts, and a marking scheme.

Three modes suit different needs: **Simple** for a quick one-click job, **Advanced** for full control of every parameter, and **Template** to start from a preset for a common subject. You can optionally enhance images from your documents (OCR and clean-up). Once a job starts, the Progress page tracks it live — showing status and credits consumed — and you can pause and resume. Everything you generate also appears in your Activity history.

Studying with Spaced Repetition

Open a deck and tap Study to begin. CogniumLearn shows one card at a time: read the question, tap **Show Answer**, then grade how well you knew it. Your grade drives the schedule — cards you find easy come back far less often, while shaky cards return soon.

The four grades:

- **Very Hard** — you did not know it — it will come back quickly.
- **Hard** — you knew it but struggled.
- **Medium** — you knew it after some thought.
- **Easy** — you knew it instantly — the interval grows the most.

Behind the scenes, the **FSRS** algorithm computes each card's next review date and its *stability* (how firmly it is learned), while a **Glicko-2** rating tracks your overall mastery of the deck along with how confident the system is in that rating. You can restrict a session to cards you have already started, or enter Revise mode to re-drill cards you flagged for review. While studying you can resize the question / answer split, zoom the text, and jump straight into the card editor to fix a mistake.

The Study Modes

Spaced repetition is one of **six ways to study** a deck. Pick the mode that fits where you are — first read, active recall, targeted revision, or a conversation with a tutor. Timed Mock Tests (covered in the next section) add a further way to pressure-test what you know.

Mode	What it is for
Spaced Repetition	The core active-recall mode. Cards are scheduled by FSRS to appear just before you would forget them; you grade each recall and the schedule adapts.
Revise	Short, focused sessions that pull only the cards your performance data flags as weakest — ideal for the morning before an exam.
Content Study	A linear, textbook-style read-through of a deck's material, for building a first mental model of brand-new topics before you start drilling.
Content Summary	A condensed, summary-level pass through a deck's material — a fast overview or last-minute refresher rather than a full read.
Curated Study	AI-built sessions woven around your real weak topics, alternating tailored study material (grounded in your own documents) with the flashcards on that topic.
Chat	A conversational tutor grounded in your deck's own cards and notes. Ask follow-up questions, get explanations, and save a useful chat as a study material.

Study Materials & Curated Study

Study materials are readable lessons — formatted HTML with images and equations — tied to a deck and available at Summary, Standard or Comprehensive detail. Browse them from the deck's Browser view, or write and edit your own in the study-material editor.

Curated Study is a guided mode where the AI weaves a lesson together with the flashcards on that topic: you read a section, then immediately drill the related cards, alternating between understanding and recall. When you switch on *auto-generate curated study material* for a deck, CogniumLearn automatically builds these flows for your weak topics after each weekly analysis.

Mock Tests & Exams

Mock tests are full, exam-style papers with automatic grading. Build one in the mock-test editor: set the title, duration and marking scheme, then add title pages, instruction blocks, sections and individual questions. Marking is flexible — award marks for correct, wrong, unattempted and partially-correct answers, with overrides per question type or per section.

When you take a test, choose **Practice** (untimed review) or **Timed** (a countdown that auto-submits at zero, with a custom duration if you like). Afterwards the answer key shows your answers beside the expected ones, with explanations and step-by-step solutions, and computes your score automatically. You can also review transcribed content extracted from your source documents before finalising a test.

Deck Insights & Performance Analysis

Every deck has an Insights page that turns your study history into a clear picture of where you stand:

- **Study metrics** — total cards, cards due today, and cards flagged for review.
- **Activity heatmap** — a calendar of your study activity over time.
- **Mastery report** — your proficiency across the deck and how it has trended.
- **Topic insights** — an AI breakdown of Weak, Strong and Volatile topics — the last flags topics where your answers keep flipping.

With auto-analysis enabled, CogniumLearn scores every studied card weekly on weakness, strength and volatility, sends the standout topics to the AI for labelling, and — if you also enabled curated study — automatically generates fresh study material for your weakest topics.

The AI Assistant — Ask AI & Chat

Help is always a tap away. While studying a card or reading a lesson, highlight any text to pop up a menu with **Explain**, **Simplify** and **Ask** — the assistant answers about exactly what you selected, and can even see images from the current card. **Chat** mode is a full conversation with a tutor grounded in your deck's own cards and notes; you can save a useful chat as a study material to keep.

There are two ways to run the AI:

- **In your browser (free)** — download a compact model that runs entirely on your device — completely private, works offline, and spends no credits. Manage the download from the Activity page.
- **In the cloud (credits)** — more capable models across Basic, Pro and Pro Plus tiers, chosen in Settings, charged per request and available in multiple languages.

Paid Deck Marketplace

Don't want to build a deck from scratch? Browse the marketplace of professionally curated decks from creators and institutions. Search across titles, categories and tags; filter by category, difficulty, creator or institution; sort by newest, rating, price or popularity; and set your region for local pricing. Each deck's detail page previews its structure, card / material / test counts and feature badges before you buy.

Purchasing is one tap. Bought decks decrypt and sync straight into your library and behave exactly like your own — spaced repetition, Ask AI and insights all work normally. Content is encrypted at rest and in transit for the creator's protection, and you are notified when a creator ships an update. Pro Plus members receive one free marketplace deck each month.

Sync, Offline Mode & Apps

Your library follows you. CogniumLearn syncs decks, cards and study progress across every device you sign in on — after each study session and whenever you make a change. From device management you can see every device, its last sync time, and remove any you no longer use (your plan sets how many devices and sessions you may have at once).

The desktop apps (Windows, macOS, Linux) and mobile apps (Android, iOS) add true offline study: pages and assets are cached locally so a full session works with no connection, and your progress syncs the moment you are back online. The apps also update themselves automatically in the background. The web version needs no installation and is always current.

Streaks, Achievements & Activity

Consistency is rewarded. Completing at least one study session a day builds a **streak**, and hitting milestones (7, 30, 100 days) earns badges you can view in your profile; you are warned before a streak is about to lapse. The Activity page is your history hub — search and filter across generation tasks (with live progress and credits used), marketplace purchases with invoices, and browser-AI model downloads.

Account & Settings

The Settings page centralises your account: view your profile and join date; check your credit balance, top up, and see purchase history; pick your preferred cloud AI tier and Ask-AI language; choose a light / dark / auto theme with custom colours; configure text-to-speech for accessibility; and manage devices, subscriptions and notifications.

How Credits Work

CogniumLearn's AI features run on **credits**. Credits are separate from your subscription: every plan includes a monthly credit allowance, and you can always buy more on top — even on the Free plan. Ordinary studying, building decks and taking tests are free; only AI work draws credits. Every transaction is logged so you can audit exactly where your credits went.

The in-study helpers (Ask AI, auto-fill, deck analysis) charge a small flat amount, while the big generation jobs are metered by the actual AI usage they consume — longer documents and more items cost more — so you only pay for what you use, and the exact estimate is shown before you commit. Current rates:

AI action	Credits	Notes
Ask AI — Basic tier	0.025 / request	In-study explanations on the entry cloud model.
Ask AI — Pro tier	0.17 / request	A more capable cloud model.
Ask AI — Pro Plus tier	1.2 / request	The most capable cloud model.
Auto-fill question options	0.3 / call	One-shot helper while editing a card.
Weekly deck analysis	~0.2 each	Auto-analysis of your weak, strong and volatile topics.
Mock-test AI evaluation	~0.2 + usage	Grading a mock-test attempt; scales with the test's length.
Generate flashcards / notes / tests	Usage-metered	About 1 credit per 350,000 input tokens plus 1 per 88,000 output tokens; estimate shown first.
Curated study material	Usage-metered	About 1 credit per 80,000 input tokens plus 1 per 35,000 output tokens.
In-browser AI (WebLLM)	Free	Runs on your own device — never charged.

New accounts start with **5 free credits**, and redeeming a promo code grants another 5. Behind-the-scenes steps (extracting text, OCR, similarity search and the like) are effectively free — only the AI actions above draw meaningful credit. Rates are set by the platform and can change.

Plans & Subscriptions

Four monthly plans scale with how much AI you use. All prices are in Indian Rupees (INR); the platform supports other currencies as they are rolled out. Each tier is cumulative — it includes everything in the tier below and raises your credit, storage, device and session limits.

Plan	Price / month	Monthly credits	Storage	Devices
Free	₹0	0	20 MB	2
Basic	₹199	25	250 MB	4
Pro	₹499	60	500 MB	5
Pro Plus	₹999	125	2 GB	6

Everyday studying — spaced repetition, revise, content reading, taking mock tests, deck insights and the free in-browser AI — is included on every plan, Free included. What the plan changes is access to the AI-powered and premium features below:

Feature	Free	Basic	Pro	Pro Plus
Ask AI (in-study Q&A)	✓	✓	✓	✓
Chat with your decks	✓	✓	✓	✓
Curated Study	✗	✓	✓	✓
Mock-test AI evaluation	✗	✓	✓	✓
Automatic content generation	✗	✗	✓	✓
Image generation	✗	✗	✗	✓
Free marketplace deck each month	✗	✗	✗	✓

Subscriptions bill monthly. You can buy extra credits on any plan, including Free, whenever you run low — so even without a subscription you can use the paid AI features on a pay-as-you-go basis, subject to that feature being available on your plan.

Coupons & Promo Codes

Promo codes and coupons unlock discounts and bonuses. Enter a code from your profile, or have one applied automatically at checkout. Depending on how it is issued, a coupon can:

- **Discount a purchase** — a percentage off, a fixed amount off, or make it entirely free.
- **Grant credits** — drop bonus credits straight into your balance.
- **Reduce a plan** — take money off a subscription.
- **Unlock a free plan or deck** — grant a plan upgrade or a marketplace deck at no cost.

Each code has a redemption limit and can be used only once per account.

Buying Credits & Payments

When you run low, top up from Settings or the credit store. Credits cost ₹10 each, and larger packs come with a built-in discount:

Credit pack	Price	You save
25 credits	₹237.50	5%
50 credits	₹450	10%
100 credits	₹800	20%

You can also buy any custom amount (from a 1-credit minimum). Pay securely through the integrated payment provider, and your credits are added to your balance the moment payment is confirmed. Purchases and invoices are recorded in your Activity history. Prices are shown in your local currency where supported.

Because AI actions can charge after a task completes, your balance may dip slightly negative on the final job — you simply top up before starting the next one. That is the whole system: study freely, spend credits only on AI, and scale up with a plan whenever it makes sense.

Happy studying. Upload something you need to learn, let CogniumLearn build the deck, and let spaced repetition do the rest.
